

**IMPORTANT –
SC.73 FIRE SECURITY LOCK**

The SC.73 is a non-deadlocking model, so that the handle withdraws the deadbolt at all times. This operation ensures that in the event of fire or other emergency, personnel are not trapped but can at all times open the door from the inside.

The SC.73 is fitted in accordance with the enclosed instructions for the SC.71 (deadlocking model) except that paragraphs 7 and 10 should be ignored. This means that you proceed by drilling all holes and fitting the cylinder and lock exactly as for the SC.71, except that the deadbolt is not thrown into the locked position when fitting the deadlock to the door.

As emergency and similar doors normally open outwards, a striking plate is supplied instead of the standard staple for doors opening inwards. Instructions for fixing the striking plate are given at the end of the instruction leaflet. If the standard striking plate (as supplied) does not fit, please return it stating the thickness of your door.
